

The Pope's condition worsens

Vatican press spokesman: "The general conditions and cardio-respiratory conditions of the Holy Father have further worsened."

04/02/2005

A gradual worsening of arterial hypotension has been noted, and breathing has become shallow.

The clinical picture indicates cardio-circulatory and renal insufficiency.

The biological parameters are notably compromised.

The Holy Father - with visible participation - is joining the continual prayers of those assisting him.
